Concept of Behaviour Trees

Behaviour Trees

Tree – A Hierarchical Structure

A tree

What is a tree?

- ▶ A **hierarchical** structure of nodes.

Behaviour Trees

Tree – A Hierarchical Structure

A tree

What is a tree?

- ▶ A **hierarchical** structure of nodes.
- ▶ Node at topmost level is called the **root node**.

Behaviour Trees

Tree – A Hierarchical Structure

A tree

What is a tree?

- ▶ A **hierarchical** structure of nodes.
- ▶ Node at topmost level is called the **root node**.
- ▶ Each node has zero or more successors, referred to as **child nodes**.

Behaviour Trees

Tree – A Hierarchical Structure

A tree

What is a tree?

- ▶ A **hierarchical** structure of nodes.
- ▶ Node at topmost level is called the **root node**.
- ▶ Each node has zero or more successors, referred to as **child nodes**.
- ▶ Nodes that have no children are called **leaf nodes**; all other nodes are called **non-leaf nodes**.

Behaviour Trees

Tree – A Hierarchical Structure

A tree

What is a tree?

- ▶ A **hierarchical** structure of nodes.
- ▶ Node at topmost level is called the **root node**.
- ▶ Each node has zero or more successors, referred to as **child nodes**.
- ▶ Nodes that have no children are called **leaf nodes**; all other nodes are called **non-leaf nodes**.
- ▶ Each node has a predecessor called **parent node**.
 - ▶ Exception: The root node has no parent.

Behaviour Trees

What Does It Contain?

- A **behaviour tree** is a hierarchical structure for controlling the execution of a set of actions.

A behaviour tree: Charge robot's battery

Behaviour Trees

What Does It Contain?

- ▶ A **behaviour tree** is a hierarchical structure for controlling the execution of a set of actions.
- ▶ It contains three types of nodes:
 - ▶ **Condition** nodes
 - ▶ **Action** nodes
 - ▶ **Control** nodes

A behaviour tree: Charge robot's battery

Behaviour Trees

What Does It Contain?

A behaviour tree: Charge robot's battery

- ▶ A **behaviour tree** is a hierarchical structure for controlling the execution of a set of actions.
- ▶ It contains three types of nodes:
 - ▶ **Condition** nodes
 - ▶ **Action** nodes
 - ▶ **Control** nodes
- ▶ Condition and action nodes are leaf nodes.
- ▶ Control nodes are non-leaf nodes.

Condition node:

- ▶ Contains a Boolean-valued variable.
- ▶ Value of *True* indicates **success**.
- ▶ Value of *False* indicates **failure**.

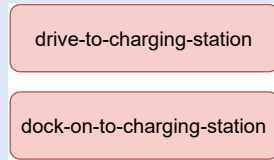

Condition node:

- ▶ Contains a Boolean-valued variable.
- ▶ Value of *True* indicates **success**.
- ▶ Value of *False* indicates **failure**.

Action node:

- ▶ Contains an action to be performed by the agent (e.g. robot).
- ▶ Action execution status: **running, success, failure**.

- ▶ Control nodes determine which child node should be executed next, i.e. how control should flow within the tree.
- ▶ Two commonly used control nodes are **selector** and **sequence**.

Selector

- ▶ Child nodes are executed one by one from left to right.
- ▶ The next child node is executed **if and only if** all the previous child nodes **failed**.

Sequence

- ▶ Child nodes are executed one by one from left to right.
- ▶ The next child node is executed **if and only if** all the previous child nodes were **successful**.

Behaviour Trees: Control Nodes

Selector Example

- ▶ Execution starts at root node.

Behaviour Trees: Control Nodes

Selector Example

- ▶ Execution starts at root node.
- ▶ Root node here is a selector node.

Behaviour Trees: Control Nodes

Selector Example

- ▶ Execution starts at root node.
- ▶ Root node here is a selector node.
 - ▶ First child node is *battery-is-charging*.

Behaviour Trees: Control Nodes

Selector Example

- ▶ Execution starts at root node.
- ▶ Root node here is a selector node.
 - ▶ First child node is *battery-is-charging*.
 - ▶ If battery is charging, then condition node is **successful**. The next child node is **not executed**.

Behaviour Trees: Control Nodes

Selector Example

- ▶ Execution starts at root node.
- ▶ Root node here is a selector node.
 - ▶ First child node is *battery-is-charging*.
 - ▶ If battery is charging, then condition node is **successful**. The next child node is **not executed**.
 - ▶ If battery is **not** charging, then condition node **failed**. Control now flows to **next child node**.

Behaviour Trees: Control Nodes

Selector Example

- ▶ Execution starts at root node.
- ▶ Root node here is a selector node.
 - ▶ First child node is *battery-is-charging*.
 - ▶ If battery is charging, then condition node is **successful**. The next child node is **not executed**.
 - ▶ If battery is **not** charging, then condition node **failed**. Control now flows to **next child node**.
 - ▶ Next child node is a sequence node.

Behaviour Trees: Control Nodes

Sequence Example

- ▶ Execution of sequence node:

Behaviour Trees: Control Nodes

Sequence Example

- ▶ Execution of sequence node:
 - ▶ First child node is the action *drive-to-charging-station*.

Behaviour Trees: Control Nodes

Sequence Example

- ▶ Execution of sequence node:
 - ▶ First child node is the action *drive-to-charging-station*.
 - ▶ If this action **failed**, then the next child node is **not executed**.

Behaviour Trees: Control Nodes

Sequence Example

- ▶ Execution of sequence node:
 - ▶ First child node is the action *drive-to-charging-station*.
 - ▶ If this action **failed**, then the next child node is **not executed**.
 - ▶ If this action is **successfully** completed, then control flows to **next child node**.

Behaviour Trees: Control Nodes

Sequence Example

- ▶ Execution of sequence node:
 - ▶ First child node is the action *drive-to-charging-station*.
 - ▶ If this action **failed**, then the next child node is **not executed**.
 - ▶ If this action is **successfully** completed, then control flows to **next child node**.
 - ▶ Next child node is the action *dock-on-to-charging-station*.

Status of a sequence node:

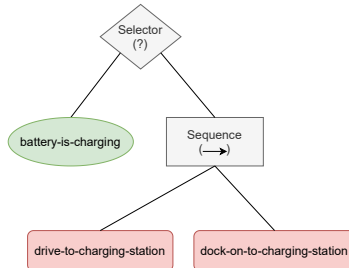

- ▶ If **one** of the child nodes fails, then **failure**.
- ▶ If one of the child nodes is running, then **running**.
- ▶ If **all** child nodes are successful, then **success**.
- ▶ Similar to logical AND operation.

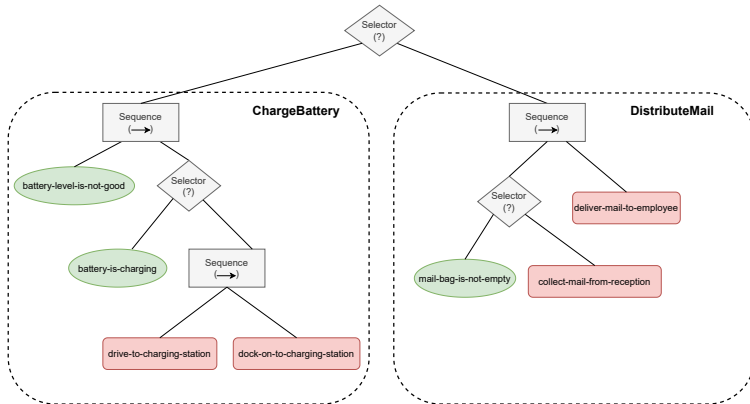

- ▶ Status of condition and action nodes: (See slide no. 6).

Status of a selector node:

- ▶ If **one** of the child nodes is successful, then **success**.
- ▶ If one of the child nodes is running, then **running**.
- ▶ If **all** child nodes failed, then **failure**.
- ▶ Similar to logical OR operation.

- ▶ Behaviour trees for simple tasks can be combined to model more complex tasks.
- ▶ Allows the reuse of subtrees in other tasks.
- ▶ If a task changes, then only the relevant subtree has to be updated.

- ▶ **Reactivity** refers to “the ability to quickly and efficiently react to changes”(Page 38 in [1]) in internal and external environments.

- ▶ **Reactivity** refers to “the ability to quickly and efficiently react to changes”(Page 38 in [1]) in internal and external environments.
- ▶ The status of a behaviour tree is checked at a specific frequency known as the **tick frequency**.

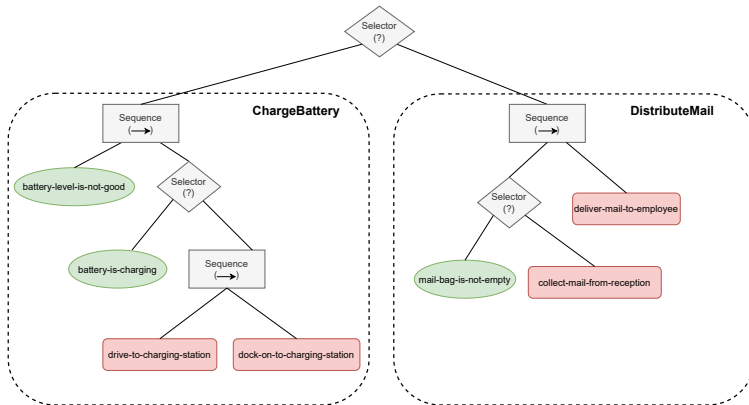

- ▶ **Reactivity** refers to “the ability to quickly and efficiently react to changes”(Page 38 in [1]) in internal and external environments.
- ▶ The status of a behaviour tree is checked at a specific frequency known as the **tick frequency**.
- ▶ Ticking begins at the root node and flows through the tree according to the logic of the control nodes.

- ▶ **Reactivity** refers to “the ability to quickly and efficiently react to changes”(Page 38 in [1]) in internal and external environments.
- ▶ The status of a behaviour tree is checked at a specific frequency known as the **tick frequency**.
- ▶ Ticking begins at the root node and flows through the tree according to the logic of the control nodes.
- ▶ If the status of any condition nodes or action nodes has changed, then it can be detected in the next ‘tick’.

- ▶ **Reactivity** refers to “the ability to quickly and efficiently react to changes”(Page 38 in [1]) in internal and external environments.
- ▶ The status of a behaviour tree is checked at a specific frequency known as the **tick frequency**.
- ▶ Ticking begins at the root node and flows through the tree according to the logic of the control nodes.
- ▶ If the status of any condition nodes or action nodes has changed, then it can be detected in the next ‘tick’.
- ▶ Any change will automatically cause the ongoing actions to be aborted or other actions to be started, depending on the control logic encoded in the tree.

[1] M. Colledanchise and P. Ögren, “Behavior Trees in Robotics and AI,” Jul. 2018, doi: 10.1201/9780429489105.

- ▶ In the following tree, if the battery level goes low while the robot is distributing letters to employees, then the robot will abort this task and drive to the docking station.

- ▶ Introduced by the gaming industry to model the behaviour of non-player characters.
- ▶ Several software libraries are available.

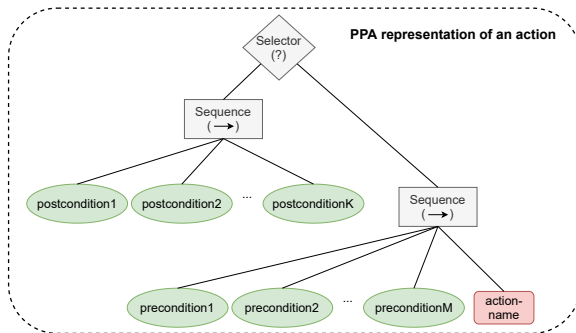

- ▶ Introduced by the gaming industry to model the behaviour of non-player characters.
- ▶ Several software libraries are available.
- ▶ The following libraries have been used in robotics:
 - ▶ BehaviorTree.CPP (written in C++)
 - ▶ Source code: <https://github.com/BehaviorTree/BehaviorTree.CPP>
 - ▶ Documentation: <https://www.behaviortree.dev/>
 - ▶ Used in the ROS 2 Navigation Stack (See here)
 - ▶ py_trees (written in Python 3)
 - ▶ Source code: https://github.com/splintered-reality/py_trees

Converting Plans to Behaviour Trees

How to Convert a Plan to a Behaviour Tree?

One Solution – The PPA-Rule

- ▶ An action has preconditions and effects (also known as postconditions).
- ▶ An action can be represented as a behaviour tree by applying the **Postcondition-Precondition-Action (PPA)** rule.

How to Convert a Plan to a Behaviour Tree?

PPA-Rule Explained 1/3

- ▶ For an action to be successful, all its postconditions should hold.
- ▶ Therefore, the postconditions are attached to a sequence node.

How to Convert a Task Plan to a Behaviour Tree?

PPA-Rule Explained 2/3

- ▶ If the current state of the world fulfils all postconditions of the action, then the action need not be executed or continued.
- ▶ Therefore, the postconditions and the action are attached to the left and right subtree, respectively, of a selector node.

How to Convert a Plan to a Behaviour Tree?

PPA-Rule Explained 3/3

- ▶ An action can be executed only if its preconditions are satisfied.
- ▶ Therefore, the action and its preconditions are attached to the same sequence node.

Note that, if preconditions or postconditions contain negations of predicates, these can be inverted before attaching to the behaviour tree.

How to Convert a Plan to a Behaviour Tree?

One Solution – The PPA-Rule

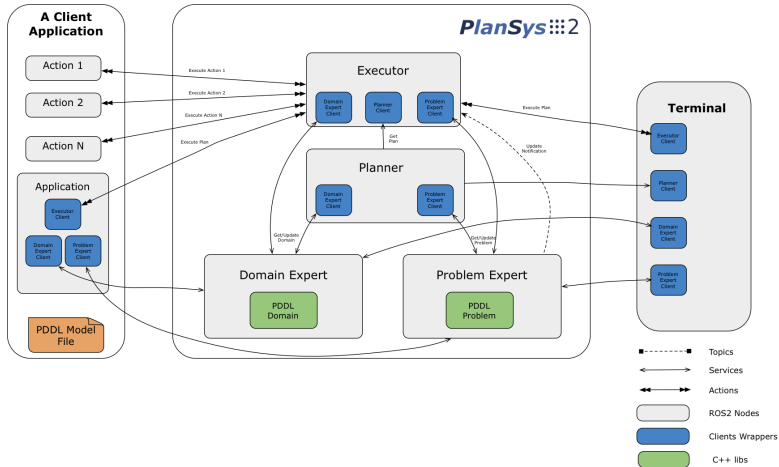

Given a plan $\pi = \langle \text{action1}, \text{action2}, \dots, \text{actionN} \rangle$, we attach the PPA representation of each action to a sequence node in the same order in which they appear in the plan.

ROS 2 Planning System 2

Summary

Key Topics Covered in This Lecture

Behaviour Trees and Plan Execution

- ▶ Definition of behaviour trees.
- ▶ Types of nodes in a behaviour tree.
- ▶ Execution of nodes in a behaviour tree.
- ▶ Achieving modularity and reactivity using behaviour trees.
- ▶ Libraries for programming behaviour trees: BehaviorTree.CPP and py_trees.
- ▶ PPA rule to convert a linearly-ordered plan into a behaviour tree.
- ▶ A planning system in ROS 2.
